

Interactive Media Experience in Unity

Horror Interactive Experience Project Report

Project Overview

This project is a horror-themed interactive media experience developed using Unity 6. The goal of the project was to create an interactive digital environment that responds dynamically to the player's actions through multiple forms of media.

The experience takes place inside a dark psychological horror room where the player explores the environment, interacts with objects, uncovers hidden patient records, and eventually triggers a disturbing ending sequence.

Media Types Used

The project successfully integrates more than four media types:

Media Type	Implementation
Graphics (3D Objects)	Full 3D horror room, furniture, desk, drawers, shadow figure, environment lighting
Audio	Ambient room sounds, whisper sound effects, intense horror audio
Text	Interaction prompts, patient logs, warning messages
Images	Distortion / glitch PNG overlay
Animation & Interaction	Drawer opening interaction, flickering light effect, ending sequence

Main Interactions

1. Room Exploration

The player can freely move around the room and inspect different areas of the environment.

2. Drawer Interaction

When the player approaches the drawer, an interaction prompt appears: "Press E to Open Drawer". Pressing E opens the drawer.

3. Reading the Patient Card

After opening the drawer, the player can press E again to read the patient information card. The displayed message includes: PATIENT ID: 0713 | STATUS: CRITICAL | Patient claims another figure appears in the room after midnight. SUBJECT MUST NOT BE LEFT IN ISOLATION.

4. Dynamic Lighting Reaction

After opening the drawer, the lamp begins flickering dynamically using randomized realtime lighting.

5. Audio Reaction

Whispering sounds begin playing after the interaction to increase tension and atmosphere.

6. Distortion Horror Effect

After a delay, a fullscreen glitch/distortion PNG overlay appears while intense horror audio starts playing.

7. Ending Sequence

The screen eventually fades to black and displays the message: "DO NOT OPEN THE DRAWER". This serves as the final horror ending.

Technical Implementation

The project was developed using Unity 6 and C# scripting.

Main Scripts

DrawerInteraction.cs

Handles:

- Opening the drawer
- Reading the patient card
- Triggering audio
- Triggering the ending sequence
- Displaying interaction prompts

LampFlicker.cs

Controls randomized horror flickering effects using realtime lighting.

UI System

The UI Canvas was used for:

- Interaction prompts
- Patient logs
- Warning messages
- Distortion image overlay

Audio System

Audio Sources were used for:

- Ambient sound
- Whisper sound effects
- Ending horror sound

Screenshots

The following screenshots capture key moments from the interactive horror experience.

Screenshot 1 – Main Horror Room

The main horror environment showcasing the lighting, furniture, and overall dark atmosphere.

Screenshot 2 – Second Room Angle

Another angle of the horror room revealing the desk setup, drawers cabinet, and shadow figure with glowing red eyes.

Screenshot 3 – Drawer Interaction Prompt

The player receives the interaction prompt: "Press E to Open Drawer".

Screenshot 4 – Patient Log Display

A patient log is revealed: "I keep hearing breathing behind the walls."

Screenshot 5 – Opened Drawer

The drawer opens revealing the hidden patient card inside. Prompt reads: "Press E to Read Card".

Screenshot 6 – Patient Card Content

The patient card is displayed: PATIENT ID: 0713 — STATUS: CRITICAL.

Screenshot 7 – Distortion Effect

The glitch/distortion PNG overlay appears fullscreen while horror audio intensifies.

Screenshot 8 – Final Ending

The screen turns black and displays: "DO NOT OPEN THE DRAWER".

Conclusion

This project successfully fulfills the Interactive Media Experience requirements by combining multiple forms of media into a single connected horror experience.

The environment reacts dynamically to player actions using:

- Graphics
- Audio
- Text
- Images
- Interactive scripting

The final result is a playable Unity horror experience with meaningful interactions and responsive media systems.
